

Atty. Docket No. DE920000055US1
(590.080)

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application. No changes to the claims have been made herein.

Listing of Claims:

1-18. (Cancelled)

19. (Previously Presented) A method of processing a continuous audio stream containing human speech from a plurality of speakers related to at least one particular transaction, comprising the steps of;

identifying a known speaker from among the plurality of speakers;

digitizing the continuous audio stream;

detecting a speaker change in the digitized audio stream;

performing a speaker recognition if a speaker change is detected; and

transcribing at least part of the continuous audio stream if the known speaker is recognized.

20. (Previously Presented) A method according to claim 19, comprising a further step of protocolling time information for detected speaker changes.

Atty. Docket No. DE920000055US1
(590.080)

21. **(Previously Presented)** A method according to claim 19, wherein the step of detecting a speaker change and/or the step of performing a speaker recognition is/are preceded by a further step of detecting non-speech boundaries between continuous speech segments.

22. **(Previously Presented)** A method according to claim 19, wherein the step of detecting a speaker change is accomplished by use of at least one characteristic audio feature, in particular features derived from the spectrum of the audio signal.

23. **(Previously Presented)** A method according to claim 19, wherein the step of performing a speaker recognition involves the particular steps of calculating a speaker signature from the audio stream and comparing the calculated speaker signature with at least one known speaker signature.

24. **(Previously Presented)** A method according to claim 19 for use in a speech recognition or voice control system comprising at least two speaker-specific speaker models and/or dictionaries, wherein interchanging between the at least two speaker-specific dictionaries is dependent on the detected speaker change and the corresponding recognized speaker.

25. **(Previously Presented)** A method of processing a continuous audio stream containing human speech of a plurality of speakers related to at least one particular transaction, comprising the steps of:

Atty. Docket No. DE920000055US1
(590.080)

identifying a known speaker from among the plurality of speakers;

digitizing the continuous audio stream;

detecting a speaker change in the digitized audio stream;

performing a speaker recognition if a speaker change is detected; and

indexing the audio stream with respect to the detected speaker change if the known speaker is recognized.

26. **(Previously Presented)** A method according to claim 25, comprising a further step of protocolling time information for detected speaker changes.

27. **(Previously Presented)** A method according to claim 25, wherein the step of detecting a speaker change and/or the step of performing a speaker recognition is/are preceded by a further step of detecting non-speech boundaries between continuous speech segments.

28. **(Previously Presented)** A method according to claim 25, wherein the step of detecting a speaker change is accomplished by use of at least one characteristic audio feature, in particular features derived from the spectrum of the audio signal.

29. **(Previously Presented)** A method according to claim 25, wherein the step of performing a speaker recognition involves the particular steps of calculating a speaker

Atty. Docket No. DE920000055US1
(590.080)

signature from the audio stream and comparing the calculated speaker signature with at least one known speaker signature.

30. **(Previously Presented)** A method according to claim 25 for use in a speech recognition or voice control system comprising at least two speaker-specific speaker models and/or dictionaries, wherein interchanging between the at least two speaker-specific dictionaries is dependent on the detected speaker change and the corresponding recognized speaker.

31. **(Previously Presented)** An apparatus for processing a continuous audio stream containing human speech from a plurality of speakers related to at least one particular transaction, comprising:

a predeterminer which predetermines at least one known speaker from among the plurality of speakers;

a detector which detects speaker changes in the audio stream;

a recognizer which recognizes the predetermined speaker in the audio stream; and

an initiator which initiates transcription of at least part of the audio stream in case of a detected speaker change and a recognized predetermined known speaker.

Atty. Docket No. DE920000055US1
(590.080)

32. **(Previously Presented)** An apparatus according to claim 31, further comprising a detector which detects non-speech boundaries between continuous speech segments.

33. **(Previously Presented)** An apparatus according to claim 31, further comprising a scanner which automatically scans a continuous audio record, in particular a continuous audio stream recorded on a data or a signal carrier, and for detecting speaker changes in the continuous audio record.

34. **(Previously Presented)** An apparatus according to claim 31, further comprising a monitor which continuously monitors a real-time continuous audio stream and performing the steps of

digitizing the continuous audio stream;

detecting a speaker change in the digitized audio stream;

performing a speaker recognition if a speaker change is detected; and

transcribing at least part of the continuous audio stream if a predetermined speaker is recognized.

35. **(Previously Presented)** An apparatus according to claim 31, further comprising a monitor which continuously monitors a real-time continuous audio stream and performing the steps of

Atty. Docket No. DE920000055US1
(590.080)

digitizing the continuous audio stream;

detecting a speaker change in the digitized audio stream;

performing a speaker recognition if a speaker change is detected; and

indexing the audio stream with respect to the detected speaker change if a predetermined speaker is recognized.

36. **(Previously Presented)** An apparatus according to claim 31, further comprising a logging device which protocols time information for the at least one detected speaker change.

37. **(Previously Presented)** An apparatus according to claim 31, comprising a marking device which marks at least the beginning of a detected speech segment related to a predetermined speaker.

38. **(Previously Presented)** An apparatus according to claim 31, comprising data base which stores speech signatures for at least two speakers.

39. **(Previously Presented)** An apparatus for processing a continuous audio stream containing human speech from a plurality of speakers related to at least one particular transaction, comprising:

a predeterminer which predetermines at least one known speaker from among the plurality of speakers;

Atty. Docket No. DE920000055US1
(590.080)

a detector which detects speaker changes in the audio stream;

a recognizer which recognizes the predetermined speaker in the audio stream; and

an indexer for indexing the audio stream dependent on a detected speaker change
and a recognized predetermined speaker.

40. (Previously Presented) An apparatus according to claim 39, further
comprising a detector which detects non-speech boundaries between continuous speech
segments.

41. (Previously Presented) An apparatus according to claim 39, further
comprising a scanner which automatically scans a continuous audio record, in particular a
continuous audio stream recorded on a data or a signal carrier, and for detecting speaker
changes in the continuous audio record.

42. (Previously Presented) An apparatus according to claim 39, further
comprising a monitor which continuously monitors a real-time continuous audio stream
and performing the steps of

digitizing the continuous audio stream;

detecting a speaker change in the digitized audio stream;

performing a speaker recognition if a speaker change is detected; and

Atty. Docket No. DE920000055US1
(590.080)

transcribing at least part of the continuous audio stream if a predetermined speaker is recognized.

43. (Previously Presented) An apparatus according to claim 39, further comprising a monitor which continuously monitors a real-time continuous audio stream and performing the steps of

digitizing the continuous audio stream;

detecting a speaker change in the digitized audio stream;

performing a speaker recognition if a speaker change is detected; and

indexing the audio stream with respect to the detected speaker change if a predetermined speaker is recognized.

44. (Previously Presented) An apparatus according to claim 39, further comprising a logging device which protocols time information for the at least one detected speaker change.

45. (Previously Presented) An apparatus according to claim 39, comprising a marking device which marks at least the beginning of a detected speech segment related to a predetermined speaker.

46. (Previously Presented) An apparatus according to claim 39, comprising data base which stores speech signatures for at least two speakers.

Atty. Docket No. DE920000055US1
(590.080)

47. (Previously Presented) A speech recognition or voice control system processing an incoming audio stream containing human speech from a plurality of speakers and having at least two speaker models and/or speaker-specific dictionaries, comprising:

a detector which detects a speaker change in the incoming audio stream;

a gatherer which gathers speaker-specific information and for comparing the gathered speaker-specific information with corresponding speaker-specific information of at least one predetermined known speaker from among the plurality of speakers thus recognizing the at least one predetermined speaker; and

an interchanger which interchanges between the at least two speaker-specific dictionaries dependent on the detected speaker change and the corresponding recognized speaker.

48. (Previously Presented) A program storage device readable by machine, tangibly embodying a program of instructions executable by the machine to perform method steps for processing a continuous audio stream containing human speech from a plurality of speakers related to at least one particular transaction, said method comprising the steps of:

identifying a known speaker from among the plurality of speakers;

Atty. Docket No. DE920000055US1
(590.080)

digitizing the continuous audio stream;

detecting a speaker change in the digitized audio stream;

performing a speaker recognition if a speaker change is detected; and

transcribing at least part of the continuous audio stream if the known speaker is recognized.

49. (Previously Presented) A program storage device readable by machine, tangibly embodying a program of instructions executable by the machine to perform method steps for processing a continuous audio stream containing human speech from a plurality of speakers related to at least one particular transaction, said method comprising the steps of:

identifying a known speaker from among the plurality of speakers;

digitizing the continuous audio stream;

detecting a speaker change in the digitized audio stream;

performing a speaker recognition if a speaker change is detected; and

indexing the audio stream with respect to the detected speaker change if the known speaker is recognized..
